# Chapter 1

## Hierarchical Index

### 1.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Area . . . . .	7
Function . . . . .	8
Function_1 . . . . .	10
Function_2 . . . . .	12
Function_3 . . . . .	13
Function_4 . . . . .	15
Function_5 . . . . .	17
OptimizationMethod . . . . .	21
Newton . . . . .	19
Stochastic . . . . .	24
StopCriterion . . . . .	26
SC_FuncRelative . . . . .	22
SC_GradientNorm . . . . .	23
SC_PointsClose . . . . .	23

## Chapter 2

# Class Index

### 2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">Area</a>	Class containing information about the given rectangular area . . . . .	7
<a href="#">Function</a>	Class implementing computing of function's value, gradient and Gesse's matrix in the given point. @detailed There are three hardcoded functions. The user is choosing one of them, implementation involved polymorphism . . . . .	8
<a href="#">Function_1</a>	$F(x, y) = \sin(x) \cdot \cos(y)$ . . . . .	10
<a href="#">Function_2</a>	$F(x, y) = 20 \cdot \exp(\sin((x+y)/20)) + xy$ . . . . .	12
<a href="#">Function_3</a>	$F(x, y) = (1-x)^2 + 100(y-x^2)^2$ . . . . .	13
<a href="#">Function_4</a>	$F(x, y, z) = \sin(x) \cdot (y^2 + 1) - z \cdot \cos(x)$ . . . . .	15
<a href="#">Function_5</a>	$F(x, y, z, w) = x^2 \cdot y^2 \cdot w + x^2 \cdot z \cdot w - z \cdot w^2$ . . . . .	17
<a href="#">Newton</a>	Class containing <a href="#">Newton</a> 's optimization method @detailed That involves computing Gesse's matrixes and gradients . . . . .	19
<a href="#">OptimizationMethod</a>	Optimizing class containing realization of determined or stochastic method. @detailed Different methods are being applied using polymorphism . . . . .	21
<a href="#">SC_FuncRelative</a>	Class that stops iterations if the absolute difference between current and previous values related to the current value is less than eps . . . . .	22
<a href="#">SC_GradientNorm</a>	Class that stops iterations if the norm of the gradient in the current point is less than eps . . .	23
<a href="#">SC_PointsClose</a>	Class that stops iterations if the norm of the difference between current and previous points are less than eps . . . . .	23
<a href="#">Stochastic</a>	Class containing stochastic optimization method @detailed That involves finding random points in general area and locally . . . . .	24
<a href="#">StopCriterion</a>	Class containing a criterion with which iterations are being stopped. @detailed There are three of them. They are implemented using polymorphism . . . . .	26

## Chapter 3

# File Index

### 3.1 File List

Here is a list of all documented files with brief descriptions:

<a href="#">Definitions.h</a>	..	??
<a href="#">Functions.h</a>	..	??
<a href="#">OptimizationMethods.h</a>	..	??
<a href="#">R64M.hpp</a>	..	??
<a href="#">StopCriteria.h</a>	..	??

## Chapter 4

# Class Documentation

### 4.1 Area Class Reference

Class containing information about the given rectangular area.

```
#include <Definitions.h>
```

#### Public Member Functions

- `bool is_in (vector< double > x)`  
*Answers the question "is the point x in this area?".*
- `Area (vector< double > lefts, vector< double > rights)`  
*Constructor.*

#### Public Attributes

- `int dim`
- `vector< double > left_borders`
- `vector< double > right_borders`

#### 4.1.1 Detailed Description

Class containing information about the given rectangular area.

#### 4.1.2 Constructor & Destructor Documentation

##### 4.1.2.1 Area()

```
Area::Area (
    vector< double > lefts,
    vector< double > rights ) [inline]
```

Constructor.

**Parameters**

<i>lefts</i>	contains left borders of the rectangular area
<i>rights</i>	contains right borders of the rectangular area

The documentation for this class was generated from the following files:

- Definitions.h
- Definitions.cpp

## 4.2 Function Class Reference

Class implementing computing of function's value, gradient and Gesse's matrix in the given point. @detailed There are three hardcoded functions. The user is choosing one of them, implementation involved polymorphism.

```
#include <Functions.h>
```

Inheritance diagram for Function:

### Public Member Functions

- virtual double [eval](#) (vector< double > x)  
*Computes function's value in the given point.*
- virtual vector< double > [eval\\_gr](#) (vector< double > x)  
*Computes function's gradient in the given point.*
- virtual vector< vector< double > > [eval\\_Gesse](#) (vector< double > x)  
*Computes function's Gesse's matrix in the given point.*

#### 4.2.1 Detailed Description

Class implementing computing of function's value, gradient and Gesse's matrix in the given point. @detailed There are three hardcoded functions. The user is choosing one of them, implementation involved polymorphism.

#### 4.2.2 Member Function Documentation

##### 4.2.2.1 [eval\(\)](#)

```
double Function::eval (
    vector< double > x ) [virtual]
```

Computes function's value in the given point.

**Parameters**

$x$	is the given point
-----	--------------------

**Returns**

[Function](#)'s value

Reimplemented in [Function\\_1](#), [Function\\_2](#), [Function\\_3](#), [Function\\_4](#), and [Function\\_5](#).

**4.2.2.2 eval\_Gesse()**

```
vector< vector< double > > Function::eval_Gesse (  
    vector< double > x ) [virtual]
```

Computes function's Gesse's matrix in the given point.

**Parameters**

$x$	is the given point
-----	--------------------

**Returns**

[Function](#)'s Gesse's matrix

Reimplemented in [Function\\_1](#), [Function\\_2](#), [Function\\_3](#), [Function\\_4](#), and [Function\\_5](#).

**4.2.2.3 eval\_gr()**

```
vector< double > Function::eval_gr (  
    vector< double > x ) [virtual]
```

Computes function's gradient in the given point.

**Parameters**

$x$	is the given point
-----	--------------------

**Returns**

[Function](#)'s gradient

Reimplemented in [Function\\_1](#), [Function\\_2](#), [Function\\_3](#), [Function\\_4](#), and [Function\\_5](#).

The documentation for this class was generated from the following files:

- Functions.h
- Functions.cpp

## 4.3 Function\_1 Class Reference

$f(x, y) = \sin(x) \cdot \cos(y)$

```
#include <Functions.h>
```

Inheritance diagram for Function\_1:

### Public Member Functions

- double [eval](#) (vector< double > x)  
*Computes function's value in the given point.*
- vector< double > [eval\\_gr](#) (vector< double > x)  
*Computes function's gradient in the given point.*
- vector< vector< double > > [eval\\_Gesse](#) (vector< double > x)  
*Computes function's Gesse's matrix in the given point.*

### 4.3.1 Detailed Description

$f(x, y) = \sin(x) \cdot \cos(y)$

### 4.3.2 Member Function Documentation

#### 4.3.2.1 eval()

```
double Function_1::eval (
    vector< double > x ) [inline], [virtual]
```

Computes function's value in the given point.

#### Parameters

x	is the given point
---	--------------------

**Returns**

[Function](#)'s value

Reimplemented from [Function](#).

**4.3.2.2 eval\_Gesse()**

```
vector< vector< double > > Function_1::eval_Gesse (
    vector< double > x ) [virtual]
```

Computes function's Gesse's matrix in the given point.

**Parameters**

$x$	is the given point
-----	--------------------

**Returns**

[Function](#)'s Gesse's matrix

Reimplemented from [Function](#).

**4.3.2.3 eval\_gr()**

```
vector< double > Function_1::eval_gr (
    vector< double > x ) [virtual]
```

Computes function's gradient in the given point.

**Parameters**

$x$	is the given point
-----	--------------------

**Returns**

[Function](#)'s gradient

Reimplemented from [Function](#).

The documentation for this class was generated from the following files:

- Functions.h
- Functions.cpp

## 4.4 Function\_2 Class Reference

$f(x, y) = 20 \cdot \exp(\sin((x+y)/20)) + xy$

```
#include <Functions.h>
```

Inheritance diagram for Function\_2:

### Public Member Functions

- double [eval](#) (vector< double > x)  
*Computes function's value in the given point.*
- vector< double > [eval\\_gr](#) (vector< double > x)  
*Computes function's gradient in the given point.*
- vector< vector< double > > [eval\\_Gesse](#) (vector< double > x)  
*Computes function's Gesse's matrix in the given point.*

### 4.4.1 Detailed Description

$f(x, y) = 20 \cdot \exp(\sin((x+y)/20)) + xy$

### 4.4.2 Member Function Documentation

#### 4.4.2.1 eval()

```
double Function_2::eval (
    vector< double > x ) [inline], [virtual]
```

Computes function's value in the given point.

#### Parameters

x	is the given point
---	--------------------

#### Returns

[Function](#)'s value

Reimplemented from [Function](#).

#### 4.4.2.2 eval\_Gesse()

```
vector< vector< double > > Function_2::eval_Gesse (
    vector< double > x ) [virtual]
```

Computes function's Gesse's matrix in the given point.

##### Parameters

$x$	is the given point
-----	--------------------

##### Returns

[Function](#)'s Gesse's matrix

Reimplemented from [Function](#).

#### 4.4.2.3 eval\_gr()

```
vector< double > Function_2::eval_gr (
    vector< double > x ) [virtual]
```

Computes function's gradient in the given point.

##### Parameters

$x$	is the given point
-----	--------------------

##### Returns

[Function](#)'s gradient

Reimplemented from [Function](#).

The documentation for this class was generated from the following files:

- Functions.h
- Functions.cpp

## 4.5 Function\_3 Class Reference

$$f(x, y) = (1-x)^2 + 100(y-x^2)^2$$

```
#include <Functions.h>
```

Inheritance diagram for Function\_3:

## Public Member Functions

- double [eval](#) (vector< double > x)  
*Computes function's value in the given point.*
- vector< double > [eval\\_gr](#) (vector< double > x)  
*Computes function's gradient in the given point.*
- vector< vector< double > > [eval\\_Gesse](#) (vector< double > x)  
*Computes function's Gesse's matrix in the given point.*

### 4.5.1 Detailed Description

$$f(x, y) = (1-x)^2 + 100(y-x^2)^2$$

### 4.5.2 Member Function Documentation

#### 4.5.2.1 eval()

```
double Function_3::eval (
    vector< double > x ) [inline], [virtual]
```

Computes function's value in the given point.

#### Parameters

<code>x</code>	is the given point
----------------	--------------------

#### Returns

[Function](#)'s value

Reimplemented from [Function](#).

#### 4.5.2.2 eval\_Gesse()

```
vector< vector< double > > Function_3::eval_Gesse (
    vector< double > x ) [virtual]
```

Computes function's Gesse's matrix in the given point.

##### Parameters

x	is the given point
---	--------------------

##### Returns

[Function](#)'s Gesse's matrix

Reimplemented from [Function](#).

#### 4.5.2.3 eval\_gr()

```
vector< double > Function_3::eval_gr (
    vector< double > x ) [virtual]
```

Computes function's gradient in the given point.

##### Parameters

x	is the given point
---	--------------------

##### Returns

[Function](#)'s gradient

Reimplemented from [Function](#).

The documentation for this class was generated from the following files:

- Functions.h
- Functions.cpp

## 4.6 Function\_4 Class Reference

$$f(x, y, z) = \sin(x) \cdot (y^2 + 1) - z \cdot \cos(x)$$

```
#include <Functions.h>
```

Inheritance diagram for Function\_4:

## Public Member Functions

- double [eval](#) (vector< double > x)  
*Computes function's value in the given point.*
- vector< double > [eval\\_gr](#) (vector< double > x)  
*Computes function's gradient in the given point.*
- vector< vector< double > > [eval\\_Gesse](#) (vector< double > x)  
*Computes function's Gesse's matrix in the given point.*

### 4.6.1 Detailed Description

$f(x, y, z) = \sin(x) * (y^2 + 1) - z * \cos(x)$

### 4.6.2 Member Function Documentation

#### 4.6.2.1 [eval\(\)](#)

```
double Function_4::eval (
    vector< double > x ) [inline], [virtual]
```

Computes function's value in the given point.

#### Parameters

<a href="#">x</a>	is the given point
-------------------	--------------------

#### Returns

[Function](#)'s value

Reimplemented from [Function](#).

#### 4.6.2.2 [eval\\_Gesse\(\)](#)

```
vector< vector< double > > Function_4::eval_Gesse (
    vector< double > x ) [virtual]
```

Computes function's Gesse's matrix in the given point.

## Parameters

$x$	is the given point
-----	--------------------

## Returns

[Function](#)'s Gesse's matrix

Reimplemented from [Function](#).

## 4.6.2.3 eval\_gr()

```
vector< double > Function_4::eval_gr (
    vector< double > x ) [virtual]
```

Computes function's gradient in the given point.

## Parameters

$x$	is the given point
-----	--------------------

## Returns

[Function](#)'s gradient

Reimplemented from [Function](#).

The documentation for this class was generated from the following files:

- Functions.h
- Functions.cpp

## 4.7 Function\_5 Class Reference

$$f(x, y, z, w) = x^2 * y^2 * w + x^2 * z * w - z * w^2$$

```
#include <Functions.h>
```

Inheritance diagram for Function\_5:

## Public Member Functions

- double [eval](#) (vector< double > x)  
*Computes function's value in the given point.*
- vector< double > [eval\\_gr](#) (vector< double > x)  
*Computes function's gradient in the given point.*
- vector< vector< double > > [eval\\_Gesse](#) (vector< double > x)  
*Computes function's Gesse's matrix in the given point.*

### 4.7.1 Detailed Description

$f(x, y, z, w) = x^2 * y^2 * w + x^2 * z * w - z * w^2$

### 4.7.2 Member Function Documentation

#### 4.7.2.1 [eval\(\)](#)

```
double Function_5::eval (
    vector< double > x ) [inline], [virtual]
```

Computes function's value in the given point.

##### Parameters

<a href="#">x</a>	is the given point
-------------------	--------------------

##### Returns

[Function](#)'s value

Reimplemented from [Function](#).

#### 4.7.2.2 [eval\\_Gesse\(\)](#)

```
vector< vector< double > > Function_5::eval_Gesse (
    vector< double > x ) [virtual]
```

Computes function's Gesse's matrix in the given point.

##### Parameters

<a href="#">x</a>	is the given point
-------------------	--------------------

## Returns

[Function](#)'s Gesse's matrix

Reimplemented from [Function](#).

## 4.7.2.3 eval\_gr()

```
vector< double > Function_5::eval_gr (
    vector< double > x ) [virtual]
```

Computes function's gradient in the given point.

## Parameters

x	is the given point
---	--------------------

## Returns

[Function](#)'s gradient

Reimplemented from [Function](#).

The documentation for this class was generated from the following files:

- Functions.h
- Functions.cpp

## 4.8 Newton Class Reference

Class containing [Newton](#)'s optimization method @detailed That involves computing Gesse's matrixes and gradients.

```
#include <OptimizationMethods.h>
```

Inheritance diagram for Newton:

### Public Member Functions

- double [get\\_alpha\\_alt](#) (vector< double > x\_n)  
*[Function](#) that computes the best step length in the direction p\_n.*
- **Newton** ([Function](#) \*F, vector< double > x\_0\_, vector< double > l\_border, vector< double > r\_border, int SC\_var=1, double eps\_=0.001, ostream \*out\_=&cout)  
*Constructor @detailed See [OptimizationMethod](#) constructor for more.*
- vector< double > **iteration** (vector< double > &x\_, double alpha)
- vector< double > [optimize](#) ()  
*Main function.*

## Public Attributes

- `vector< double > p_n`

### 4.8.1 Detailed Description

Class containing [Newton](#)'s optimization method @detailed That involves computing Gesse's matrixes and gradients.

### 4.8.2 Member Function Documentation

#### 4.8.2.1 `get_alpha_alt()`

```
double Newton::get_alpha_alt (
    vector< double > x_n )
```

[Function](#) that computes the best step length in the direction `p_n`.

##### Parameters

$x \leftrightarrow$ _n	The point of current iteration
---------------------------	--------------------------------

##### Returns

The fraction of `p_n` with which the next iteration will be optimal

#### 4.8.2.2 `optimize()`

```
vector< double > Newton::optimize ( ) [virtual]
```

Main function.

##### Returns

The point of last iteration

Reimplemented from [OptimizationMethod](#).

The documentation for this class was generated from the following files:

- `OptimizationMethods.h`
- `OptimizationMethods.cpp`

## 4.9 OptimizationMethod Class Reference

Optimizing class containing realization of determined or stochastic method. @detailed Different methods are being applied using polymorphism.

```
#include <OptimizationMethods.h>
```

Inheritance diagram for OptimizationMethod:

### Public Member Functions

- [OptimizationMethod](#) ([Function](#) \*F, vector< double > x\_0\_, vector< double > l\_border, vector< double > r\_border, int SC\_var=1, double eps=0.001, ostream \*out\_=&cout)

*Constructor.*

- virtual vector< double > [optimize](#) ()

*Main function.*

### Public Attributes

- [Area D](#)
- [Function](#) \* f
- [StopCriterion](#) \* SC
- vector< double > x\_0
- double answer

### 4.9.1 Detailed Description

Optimizing class containing realization of determined or stochastic method. @detailed Different methods are being applied using polymorphism.

### 4.9.2 Constructor & Destructor Documentation

#### 4.9.2.1 OptimizationMethod()

```

OptimizationMethod::OptimizationMethod (
    Function * F,
    vector< double > x_0_,
    vector< double > l_border,
    vector< double > r_border,
    int SC_var = 1,
    double eps = 0.001,
    ostream * out_ = &cout )
  
```

Constructor.

**Parameters**

<i>F</i>	is one of the hardcoded functions (see <a href="#">Functions.h</a> for more)
<i>x_0_</i>	starting point
<i>SC_var</i>	current variant of stop criterion (see <a href="#">StopCriteria.h</a> for more)

**4.9.3 Member Function Documentation****4.9.3.1 optimize()**

```
virtual vector< double > OptimizationMethod::optimize ( ) [inline], [virtual]
```

Main function.

**Returns**

The point of last iteration

Reimplemented in [Newton](#), and [Stochastic](#).

The documentation for this class was generated from the following files:

- OptimizationMethods.h
- OptimizationMethods.cpp

**4.10 SC\_FuncRelative Class Reference**

Class that stops iterations if the absolute difference between current and previous values related to the current value is less than eps.

```
#include <StopCriteria.h>
```

Inheritance diagram for SC\_FuncRelative:

## Additional Inherited Members

### 4.10.1 Detailed Description

Class that stops iterations if the absolute difference between current and previous values related to the current value is less than eps.

The documentation for this class was generated from the following files:

- StopCriteria.h
- StopCriteria.cpp

## 4.11 SC\_GradientNorm Class Reference

Class that stops iterations if the norm of the gradient in the current point is less than eps.

```
#include <StopCriteria.h>
```

Inheritance diagram for SC\_GradientNorm:

## Additional Inherited Members

### 4.11.1 Detailed Description

Class that stops iterations if the norm of the gradient in the current point is less than eps.

The documentation for this class was generated from the following files:

- StopCriteria.h
- StopCriteria.cpp

## 4.12 SC\_PointsClose Class Reference

Class that stops iterations if the norm of the difference between current and previous points are less than eps.

```
#include <StopCriteria.h>
```

Inheritance diagram for SC\_PointsClose:

## Additional Inherited Members

### 4.12.1 Detailed Description

Class that stops iterations if the norm of the difference between current and previous points are less than eps.

The documentation for this class was generated from the following files:

- StopCriteria.h
- StopCriteria.cpp

## 4.13 Stochastic Class Reference

Class containing stochastic optimization method @detailed That involves finding random points in general area and locally.

```
#include <OptimizationMethods.h>
```

Inheritance diagram for Stochastic:

## Public Member Functions

- `vector< double > iteration (vector< double > x, double &delta)`  
*Function computing the next iteration.*
- `vector< double > optimize ()`  
*Main function.*
- `Stochastic (Function *F, vector< double > x_0_, vector< double > l_border, vector< double > r_border, int SC_var=1, double eps_=0.001, ostream *out_=&cout, double alpha_=0.2, double p_=0.5)`  
*Constructor.*

## Public Attributes

- double **alpha**
- double **p**

### 4.13.1 Detailed Description

Class containing stochastic optimization method @detailed That involves finding random points in general area and locally.

## 4.13.2 Constructor & Destructor Documentation

### 4.13.2.1 Stochastic()

```
Stochastic::Stochastic (
    Function * F,
    vector< double > x_0_,
    vector< double > l_border,
    vector< double > r_border,
    int SC_var = 1,
    double eps_ = 0.001,
    ostream * out_ = &cout,
    double alpha_ = 0.2,
    double p_ = 0.5 ) [inline]
```

Constructor.

#### Parameters

<i>alpha</i>	is delta's iterational multiplier @detailed See <a href="#">OptimizationMethod</a> constructor for more
--------------	---

## 4.13.3 Member Function Documentation

### 4.13.3.1 iteration()

```
vector< double > Stochastic::iteration (
    vector< double > x,
    double & delta )
```

[Function](#) computing the next iteration.

#### Parameters

<i>delta</i>	is the local square's rib length. Where local square is an area in which the local search will be done with the probability p
--------------	---

### 4.13.3.2 optimize()

```
vector< double > Stochastic::optimize ( ) [virtual]
```

Main function.

**Returns**

The point of last iteration

Reimplemented from [OptimizationMethod](#).

The documentation for this class was generated from the following files:

- OptimizationMethods.h
- OptimizationMethods.cpp

## 4.14 StopCriterion Class Reference

Class containing a criterion with which iterations are being stopped. @detailed There are three of them. They are implemented using polymorphism.

```
#include <StopCriteria.h>
```

Inheritance diagram for StopCriterion:

### Public Member Functions

- virtual bool [do\\_we\\_stop](#) (vector< vector< double > > &a, [Function](#) \*F, int iteration\_number)  
*Main function.*
- [StopCriterion](#) (double ep=0.001, int bo=1000, ostream \*out\_=nullptr)  
*Constructor.*

### Public Attributes

- double **eps**
- ostream \* **out**

### Protected Attributes

- int **bound**

#### 4.14.1 Detailed Description

Class containing a criterion with which iterations are being stopped. @detailed There are three of them. They are implemented using polymorphism.

## 4.14.2 Constructor & Destructor Documentation

### 4.14.2.1 StopCriterion()

```
StopCriterion::StopCriterion (
    double ep = 0.001,
    int bo = 1000,
    ostream * out_ = nullptr ) [inline]
```

Constructor.

#### Parameters

<i>bo</i>	is the upper bound of iterations number
-----------	---

## 4.14.3 Member Function Documentation

### 4.14.3.1 do\_we\_stop()

```
virtual bool StopCriterion::do_we_stop (
    vector< vector< double > > & a,
    Function * F,
    int iteration_number ) [inline], [virtual]
```

Main function.

#### Parameters

<i>a</i>	contains the trajectory of iterations
<i>F</i>	is a function that is being minimized

#### Returns

true if iterations are to be stopped, false otherwise

The documentation for this class was generated from the following file:

- StopCriteria.h
